EN 13501-1 STANDARD

EN 13501 is the European standard for fire resistance. Its evaluation criteria differ from those of the equivalent German standard (DIN 4102). Both classifications are still used, but building materials are only assessed and approved according to EN 13501 since 2001. EN 13501 provides for an additional subcategory for floor coverings with the suffix «fl» (from the English «flooring»).

The fire resistance classes are used to classify materials according to their reaction to fire. In principle, there are four levels: non-combustible, fireproof, normally flammable, easily flammable.

This applies to both the EN 13501 standard and the conventional DIN 4102 standard. In addition, the evaluation process for EN 13501 includes criteria such as smoke production and the presence of ignited droplets. The production of smoke is indicated by the abbreviation «s» (from the English «smoke») and the presence of flaming droplets is indicated by the abbreviation «d» (from the English «droplets»).

Dfl-s1 Classified as «Normally Flammable».

Dfl-s2 Classified as «Normally Flammable».

A dramatic, high-contrast image of a stormy sky. Dark, heavy clouds fill the upper portion, while a bright, glowing light source, likely the sun or moon, breaks through the clouds in the lower-left quadrant, creating a strong lens flare and illuminating the surrounding cloud layers. The overall color palette is dominated by deep blues, greys, and bright whites from the light source.
